

```
1 // *** GLOBAL SCOPE ***
2 // global_count is a global variable declared in source code file
   ExternalGlobalVariablesInMultipleFiles.c
3 // To access it in this file, it must first be re-declared as an external variable
   in the global scope of this file along with the 'extern' keyword and its proper
   data type
4 // Then, it can be used as any ordinary global variable throughout this file as
   well
5 // Here, Re-declaring 'global_count' as a local variable using 'extern' keyword
   within change_count_two()
6
7 #include <stdio.h>
8
9 void change_count_two(void)
10 {
11     //code
12     extern int global_count;
13     global_count = global_count + 1;
14     printf("change_count_two() : Value Of global_count in File_02 = %d\n",
        global_count);
15 }
16
```
